SIMATS ENGINEERING (SAVEETHA SCHOOL OF ENGINEERING)

Department of Artificial Intelligence and Data Science

ASSESSMENT TOOL 3 – CODING CHALLENGE

Course Code:	DSA03	**Course Title:**	Natural Language Processing
CO Assessed:	CO1 – Imitation (L1)	**Assessment:**	Assessment Tool 3 – Coding Challenge
Weightage:	30% of CIA		
CO5 Statement:	Analyse NLP models, regular expression patterns, finite state automata, morphological processing techniques and to interpret language processing. (BL-3)		
Student Name:	V.Sireesha	**Reg. No.:**	192472208
Section / Batch:	Slot - A	**Date:**	27/07/2026

Code of Conduct

I _____ (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: _____

Instructions

- Develop a complete and modular Python program that meets all the functional requirements specified in the coding challenge using appropriate algorithms, data structures, and programming practices.
- Test the program using multiple valid and invalid test cases, and clearly display the input, processing, and output to verify the correctness of the implementation.
- Follow standard coding practices by using meaningful variable names, proper indentation, comments, exception handling (where applicable), and upload the source code, sample outputs, and README file to the designated GitHub repository.
- Duration: 40 minutes.

Section / Topic	Focus	Q Nos
Regular Expression Pattern Matching	Regular Expressions, Basic Regular Expression Patterns	1
Finite State Automata Implementation	Finite State Automata, Models and Algorithms	2
Advanced Regular Expression Search	Regular Expressions, Basic Regular Expression Patterns	3

Annexure A – Coding Challenge

Section 1: Intelligent Email and Password Validator using Regular Expressions

1. **Problem Statement:**

A software company is developing a user registration system. Before creating an account, the system must validate user credentials based on predefined security policies.

Develop a Python application that validates:
Email Address
Password
Mobile Number

using Regular Expressions.

Validation Rules
Email
Must start with an alphabet.
May contain letters, digits, '.', '_' before '@'.
Domain should contain only alphabets.
Valid extensions: .com, .org, .edu, .net, .in
Password
Minimum 8 characters
At least one uppercase letter
At least one lowercase letter
At least one digit
At least one special character (@,#,$,%,&,!)
Mobile Number
Must contain exactly 10 digits.
First digit should be between 6–9.
Expected Output

Display:

Valid Email / Invalid Email
Strong Password / Weak Password
Valid Mobile Number / Invalid Mobile Number

Section 2: Design a Finite State Automata (FSA) Simulator

2. **Problem Statement**

Develop a Python-based Deterministic Finite Automata (DFA) simulator.

The program should:

- Accept the DFA description
    - States
    - Input alphabet
    - Transition table
    - Initial state
    - Final state(s)
- Accept multiple input strings.
- Simulate state transitions.
- Display whether the string is Accepted or Rejected.

Example

Language:
Strings ending with "ab"

Input
abaab

Output
Transition Path:
q0 → q1 → q0 → q1 → q2
Accepted

Section 3: Smart Pattern Matching Engine using Regular Expressions

3. Problem Statement

Develop a Python-based text search engine that performs pattern matching using Regular Expressions.

The system should support:
Word Search
Prefix Search
Suffix Search
Date Search
Phone Number Search
Hashtag Search
Mention (@username) Search

Example Input
Meeting on 12/09/2026
Call 9876543210
#NLP
@OpenAI
natural language processing

User Menu
1.Search Date
2.Search Phone Number
3.Search Hashtag
4.Search Mention
5.Search Prefix
6.Search Suffix

Expected Output
Display all matching patterns based on user selection.

Rubrics for Calculation

Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Problem Understanding	20%	Clearly understands problem constraints, edge cases, and competitive requirements	Understands problem with minor gaps in constraints	Partial understanding; misses key constraints	Misinterprets problem or constraints
Algorithm	25%	Selects optimal algorithm with best time and space complexity for competitive constraints	Uses efficient algorithm with minor scope for improvement	Uses basic/inefficient approach	No clear algorithmic approach
Code Implementation	20%	Writes correct, efficient, and clean code that passes all constraints	Code works with minor errors or inefficiencies	Partially correct code; fails for some cases	Code does not execute or gives incorrect results
Competitive Performance	20%	Solves problem within time limits and handles large inputs effectively	Solves within acceptable time with minor delays	Struggles with time limits or larger inputs	Unable to solve within time constraints
Test Case Handling	15%	Handles all test cases including edge and hidden cases	Handles most test cases	Misses important edge cases	Fails on multiple test cases

Q. No. / Criteria	Problem Understanding	Algorithm	Code Implementation	Competitive Performance	Test Case Handling	Sub. Total	Total %
1							
2							
3

1. Intelligent Email and Password Validator using Regular Expressions

Aim

To develop a Python program that validates an email address, password, and mobile number using Regular Expressions according to the given security rules.

Procedure

1. Import the re module.
2. Read the email, password, and mobile number from the user.
3. Define regular expressions for email, password, and mobile number.
4. Match the input with the corresponding regex pattern.
5. Display whether each input is valid or invalid.
6. Stop the program.

Code

```
import re
email = input("Enter Email: ")
password = input("Enter Password: ")
mobile = input("Enter Mobile Number: ")
email_pattern = r'^[A-Za-z][A-Za-z0-9._]*@[A-Za-z]+\.(com|org|edu|net|in)$'
password_pattern = r'^(?=.*[A-Z])(?=.*[a-z])(?=.*\d)(?=.*[@#$%&!]).{8,}$'
mobile_pattern = r'^[6-9]\d{9}$'
if re.fullmatch(email_pattern, email):
    print("Valid Email")
else:
    print("Invalid Email")
if re.fullmatch(password_pattern, password):
    print("Strong Password")
else:
    print("Weak Password")
if re.fullmatch(mobile_pattern, mobile):
    print("Valid Mobile Number")
else:
    print("Invalid Mobile Number")
```

Sample Input

```
Enter Email: abc123@gmail.com
Enter Password: Abc@1234
Enter Mobile Number: 9876543210
```

Sample Output

Valid Email
Strong Password
Valid Mobile Number

Result

Thus, the Python program to validate email, password, and mobile number using Regular Expressions was implemented and executed successfully.

2. Design a Finite State Automata (DFA) Simulator

Aim

To develop a Python program that simulates a Deterministic Finite Automata (DFA) and checks whether an input string is accepted or rejected.

Procedure

1. Define DFA states and transitions.
2. Read the input string.
3. Start from the initial state.
4. Process each character using the transition table.
5. Display the transition path.
6. Check whether the final state is reached.
7. Display Accepted or Rejected.

Code

```
transitions = {
    ('q0', 'a'): 'q1',
    ('q0', 'b'): 'q0',
    ('q1', 'a'): 'q1',
    ('q1', 'b'): 'q2',
    ('q2', 'a'): 'q1',
    ('q2', 'b'): 'q0'
}
state = 'q0'
final_state = 'q2'
string = input("Enter String: ")
path = [state]
for ch in string:
    if (state, ch) in transitions:
```

```
        state = transitions[(state, ch)]
        path.append(state)
    else:
        print("Invalid Input")
        exit()
print("Transition Path:", " -> ".join(path))
if state == final_state:
    print("Accepted")
else:
    print("Rejected")
```

Sample Input

Enter String: abaab

Sample Output

Transition Path:
q0 -> q1 -> q2 -> q1 -> q1 -> q2
Accepted

Result

Thus, the DFA simulator was implemented successfully and verified whether the given input string was accepted or rejected.

3. Smart Pattern Matching Engine using Regular Expressions

Aim

To develop a Python program that searches dates, phone numbers, hashtags, mentions, prefixes, and suffixes using Regular Expressions.

Procedure

1. Import the re module.
2. Read the input text.
3. Display the search menu.
4. Read the user's choice.
5. Apply the corresponding regular expression.
6. Display all matching patterns.
7. Stop the program.

Code

```
import re
text = """
Meeting on 12/09/2026
Call 9876543210
#NLP
@OpenAI
natural language processing
"""
print("1.Date")
print("2.Phone Number")
print("3.Hashtag")
print("4.Mention")
print("5.Prefix")
print("6.Suffix")
choice = int(input("Enter Choice: "))
if choice == 1:
    print(re.findall(r'\d{2}/\d{2}/\d{4}', text))
elif choice == 2:
    print(re.findall(r'[6-9]\d{9}', text))
elif choice == 3:
    print(re.findall(r'#\w+', text))
elif choice == 4:
    print(re.findall(r'@\w+', text))
elif choice == 5:
    prefix = input("Enter Prefix: ")
    print(re.findall(r'\b' + prefix + r'\w*', text))
elif choice == 6:
    suffix = input("Enter Suffix: ")
    print(re.findall(r'\w*' + suffix + r'\b', text))
else:
    print("Invalid Choice")
```

Sample Input

Enter Choice: 2

Sample Output

['9876543210']

Result

Thus, the Smart Pattern Matching Engine using Regular Expressions was implemented successfully and the required patterns were extracted from the given text.
